

CS 2731

# Introduction to Natural Language Processing

Session 11: Neural networks part 1

---

Michael Miller Yoder

October 1, 2025

University of  
Pittsburgh

School of Computing and Information

# Quiz

- Go to **Quizzes > Quiz 10-01** on Canvas
- You have until **2:40pm** to complete it
- Allowed resources
  - Textbook
  - Your notes (on a computer or physical)
  - Course slides and website
- Resources not allowed
  - Generative AI
  - Internet searches

# Course logistics: homework

- [Homework 2](#) is **due next Thu Oct 9**
  - Michael will post the Kaggle competition soon

# Course logistics: project

- Next project deliverable: [project proposal](#) due **Oct 16**
  - Will include plans for **task, data, methods, evaluation**
  - Include example input and output
  - Literature review of at least 3 related papers
  - Feel free to email or book office hours with Michael to discuss
- We have \$150 total as a class to use on OpenAI LLM credits
- Michael will let you know about open-source models set up on School of Computing and Information servers

# Midterm course evaluation (OMETs)

- <https://go.blueja.io/Iq36newH2UeDZRnTEA4pDg>
- All types of feedback are welcome (critical and positive)
- **Completely anonymous, will not affect grades**
- Let me know what's working and what to improve on while the course is still running!
- Please be as specific as possible
- Available until **next Mon Oct 6**

# Structure of this course

## MODULE 1

### Introduction and text processing

text normalization, machine learning, NLP tasks

## MODULE 2

statistical machine learning

n-grams

language modeling  
text classification

## MODULE 3

neural networks

static word vectors

text classification

## MODULE 4

transformers and LLMs

contextual word vectors

language modeling  
text classification

## MODULE 5

Sequence labeling and parsing

## MODULE 6

NLP applications and ethics

# Lecture overview: neural networks part 1

- Neural network fundamentals
- Non-linear activation functions
- Feedforward neural networks as classifiers
- Feedforward neural networks with word embedding input
- Coding activity

# Neural network fundamentals

---

# This is in your brain

# Neural network unit: This is not in your brain

Output value

Non-linear transform

Weighted sum

Input layer

# The Variables in Our Very Important Formula

- x** A vector of features of  $n$  dimensions (like number of positive sentiment words, length of document, etc.)
- w** A vector of weights of  $n$  dimensions specifying how discriminative each feature is
- b** A scalar bias term that shifts  $z$
- z** The raw score
- y** A random variable (e.g.,  $y = 1$  means positive sentiment and  $y = 0$  means negative sentiment)

# The Fundamentals

The fundamental equation that describes a unit of a neural network should look very familiar:

$$z = b + \sum_i w_i x_i \quad (1)$$

Which we will represent as

$$z = \mathbf{w} \cdot \mathbf{x} + b \quad (2)$$

But we do not use  $z$  directly. Instead, we pass it through a non-linear function, like the sigmoid function:

$$y = \sigma(z) = \frac{1}{1 + e^{-z}} \quad (3)$$

(which has some nice properties even though, in practice, we will prefer other functions like tanh and ReLU).

# A Unit Illustrated

Take, for example, a scenario in which our unit has the weights  $[0.1, 0.4, 0.2]$  and the bias term  $0.4$  and the input vector  $x$  has the values  $[0.3, 0.2, 0.9]$ .

# Filling in the Input Values and Weights

# Multiplying the Input Values and Weights and Summing Them (with the Bias Term)

$$Z = x_1w_1 + x_2w_2 + x_3w_3 + b = 0.1(0.3) + 0.4(0.2) + 0.2(0.9) + 0.4 = 0.69 \quad (4)$$

# Applying the Activation Function (Sigmoid)

$$y = \sigma(0.69) = \frac{1}{1 + e^{-0.69}} = 0.67 \quad (5)$$

# Non-linear activation functions

---

# Non-Linear Activation Functions

We're already seen the sigmoid for logistic regression:

Sigmoid

$$y = \sigma(z) = \frac{1}{1 + e^{-z}}$$

# Nonlinear activation functions besides sigmoid

tanh

Most common:

ReLU  
Rectified Linear

# Feedforward neural networks

---

Adding multiple units to a neural network increases its power to learn patterns in data. **Feedforward Neural Nets (FFNNs or MLPs)**

# Feedforward Neural Networks

Can also be called **multi-layer perceptrons** (or **MLPs**) for historical reasons

The simplest FFNN is just binary logistic regression  
(INPUT LAYER = feature vector)

# Binary Logistic Regression as a 1-layer Network

(we don't count the input layer in counting layers!)

# Multinomial Logistic Regression as a 1-layer Network

Fully connected single layer network

The real power comes when multiple layers are added

# Two-Layer Network with scalar output

Output layer  
( $\sigma$  node)

hidden units  
( $\sigma$  node)

Input layer  
(vector)

# Two-Layer Network with scalar output

Output layer  
( $\sigma$  node)

hidden units  
( $\sigma$  node)

Input layer  
(vector)

# Two-Layer Network with scalar output

Output layer  
( $\sigma$  node)

hidden units  
( $\sigma$  node)

Input layer  
(vector)

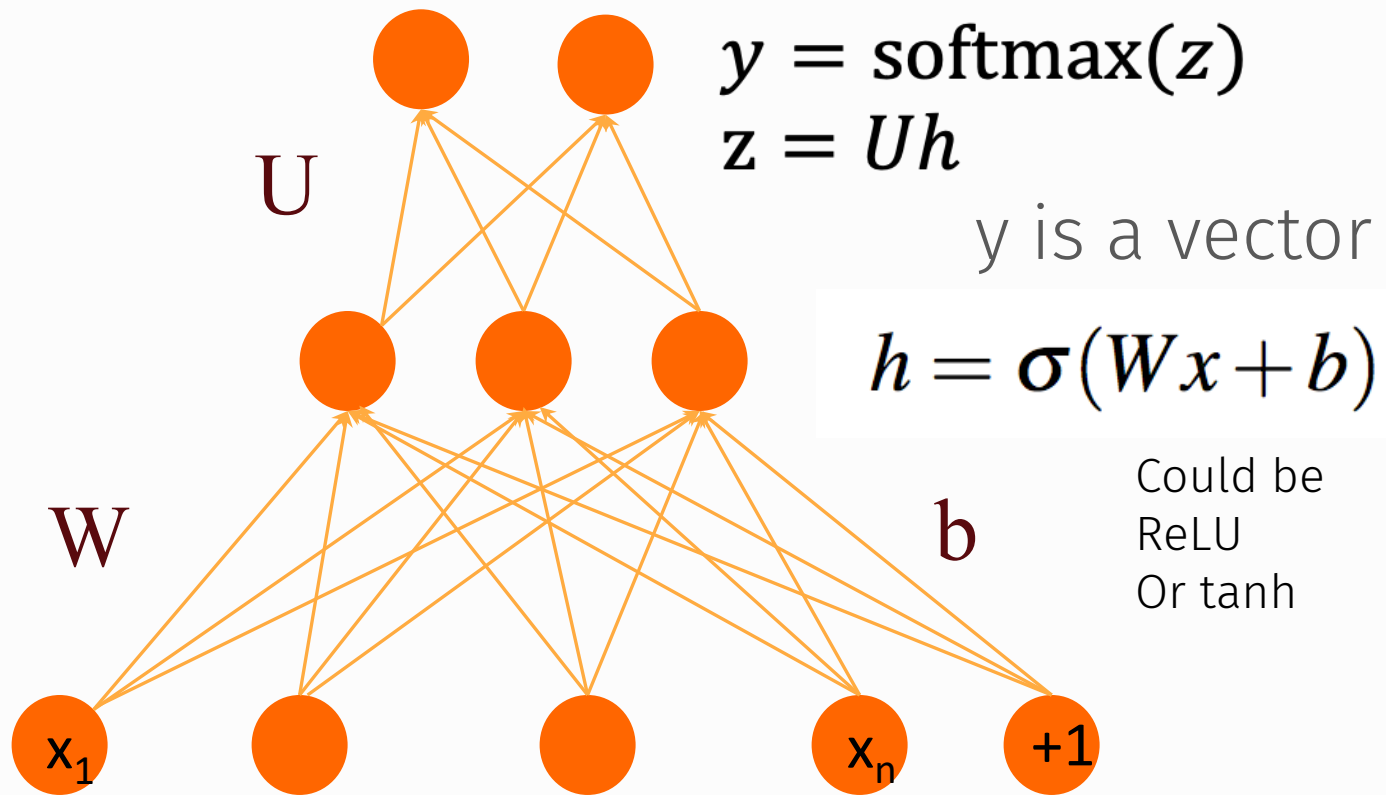

# Two-Layer Network with softmax output

Output layer  
( $\sigma$  node)

hidden units  
( $\sigma$  node)

Input layer  
(vector)

# Multi-layer Notation

$$y = a^{[2]}$$

$$a^{[2]} = g^{[2]}(z^{[2]}) \quad \text{sigmoid or softmax}$$

$$z^{[2]} = W^{[2]}a^{[1]} + b^{[2]}$$

$$a^{[1]} = g^{[1]}(z^{[1]}) \quad \text{ReLU}$$

$$z^{[1]} = W^{[1]}a^{[0]} + b^{[1]}$$

# A Forward Pass in Terms of Multi-Layer Notation

```
for each  $i \in 1..n$  do  
     $z^{[i]} \leftarrow W^{[i]}a^{[i-1]} + b^{[i]}$   
     $a^{[i]} \leftarrow g^{[i]}(z^{[i]})$   
end for  
 $\hat{y} \leftarrow a^{[n]}$ 
```

# Replacing the bias unit

Instead of:

We'll do this:

# Feedforward neural nets as classifiers

---

# Classification: Sentiment Analysis

We could do exactly what we did with logistic regression

Input layer are binary features as before

Output layer is 0 or 1

# Sentiment Features

Var	Definition
$x_1$	$\text{count}(\text{positive lexicon}) \in \text{doc}$
$x_2$	$\text{count}(\text{negative lexicon}) \in \text{doc}$
$x_3$	$\begin{cases} 1 & \text{if "no"} \in \text{doc} \\ 0 & \text{otherwise} \end{cases}$
$x_4$	$\text{count}(\text{1st and 2nd pronouns}) \in \text{doc}$
$x_5$	$\begin{cases} 1 & \text{if "!"} \in \text{doc} \\ 0 & \text{otherwise} \end{cases}$
$x_6$	$\log(\text{word count of doc})$

# Feedforward nets for simple classification

Logistic Regression

2-layer feedforward network

Just adding a hidden layer to logistic regression

- allows the network to use non-linear interactions between features
- which may (or may not) improve performance.

# Feedforward neural networks with word embedding input

---

# Even better: representation learning

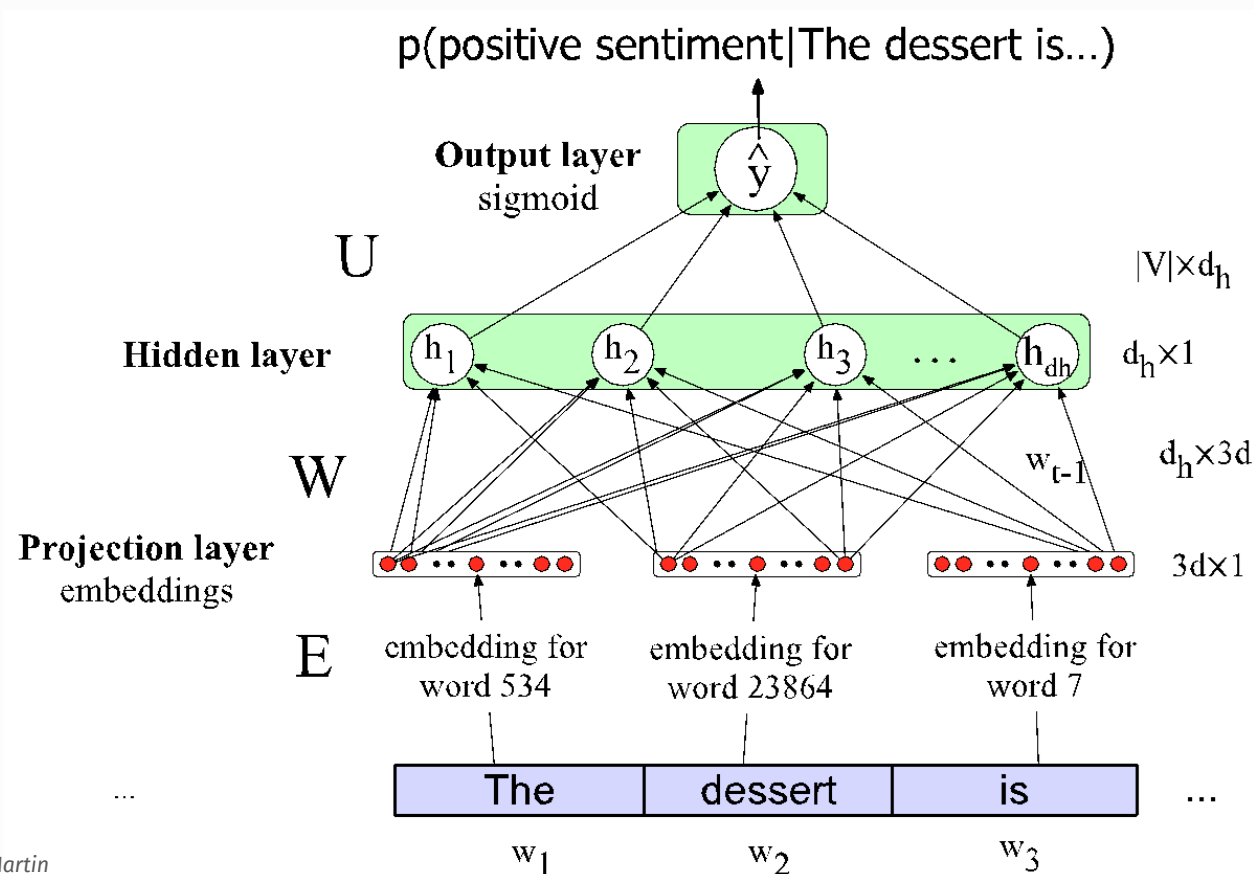

The real power of deep learning comes from the ability to **learn** features from the data

Instead of using hand-built human-engineered features for classification

Use learned representations like embeddings!

# Neural net classification with embeddings as input features!

# Issue: texts come in different sizes

This assumes a fixed size length (3)!

Kind of unrealistic.

Some simple solutions:

1. Make the input the length of the longest review
  - If shorter then pad with zero embeddings
  - Truncate if you get longer reviews at test time
2. Create a single "sentence embedding" (the same dimensionality as a word) to represent all the words
  - Take the mean of all the word embeddings
  - Take the element-wise max of all the word embeddings
    - For each dimension, pick the max value from all words

# Coding activity

---
